

MINDCARE

Project Synopsis — Mental Wellness & Self-Care Mobile Application

Project Title

MindCare — Mental Wellness and Self-Care Mobile Application

1. Introduction

MindCare is a Flutter-based mobile application designed to support everyday mental wellness and self-care. It brings mood tracking, meditation, Unwind activities, relaxation audio, journaling, progress monitoring and user preferences together in one application. The project focuses on providing a simple and accessible interface that encourages healthy mindfulness habits.

2. Problem Statement

Wellness activities are often spread across different applications, making it difficult to maintain a consistent routine and review personal activity. MindCare addresses this by providing common self-care and mindfulness features in one application with connected progress tracking.

3. Objectives

- Provide an easy-to-use platform for mood and wellness tracking.
- Provide meditation and Unwind activities.
- Allow users to maintain journal information.
- Track meditation sessions, minutes, Unwind sessions, streaks and weekly activity.
- Display progress through Home, Profile and Analytics.
- Provide a modular foundation for future cloud synchronization and additional features.

4. Major Features

Home: personalized greeting, mood, streak/progress, weekly activity, journal, quick actions and About MindCare.

Meditation: timed sessions with audio, pause/resume and completion tracking.

Unwind: relaxation and mindfulness activities with completion tracking.

Listen: ambient, mindfulness, sleep/relaxation and focus audio categories.

Journal: personal journaling and reflection.

Analytics: wellness activity and statistics.

Profile: name, statistics, streak, weekly activity and preferences.

5. Technology Stack

Flutter and Dart; Firebase/Cloud Firestore for backend-related functionality; SharedPreferences for lightweight local persistence; Provider/ChangeNotifier for state management where required; and audioplayers for audio playback.

6. Project Architecture

The project is organized into screens, reusable widgets, models and service classes. UI screens communicate with services for storage and backend operations. A simplified flow is: **User Action** → **Screen/Widget** → **Service/Provider** → **Local Storage or Firebase** → **Updated Data** → **UI Refresh**. ProgressService centralizes meditation sessions, meditation minutes, Unwind sessions, streaks and weekly activity so Home and Profile can display consistent progress.

7. Team Members and Responsibilities

Member	Role / Contribution
Varun Pratap Singh	Team Leader ; project coordination, overall integration, core Flutter development, ProgressService, Profile, Home integration and progress tracking.
Vansh Choudhary	Flutter development, project planning/support and feature integration.
Vedant	Mood tracking and Firebase/Firestore-related functionality.
Vivek Kaushik	Meditation, Unwind and audio-related functionality.
Yash Thakur	UI components, Journal support, testing, documentation and presentation support.

9. Expected Outcome

The completed application provides a functional wellness companion where users can track mood, perform meditation and Unwind activities, access relaxation resources, maintain journal information and review personal progress.

10. Future Scope

Future versions can include full cloud synchronization, stronger account management, reminders, personalized recommendations, an expanded audio library, richer analytics and additional customization.

11. Note

MindCare is intended as a wellness and self-care application. It is not a medical diagnostic or treatment application.
